## Problem

Addressing compliance matter was eating up big chunks of management’s time and attention in one of the leading producer of a wide range of high quality complex fertilizers of various grades.

## Diagnosis

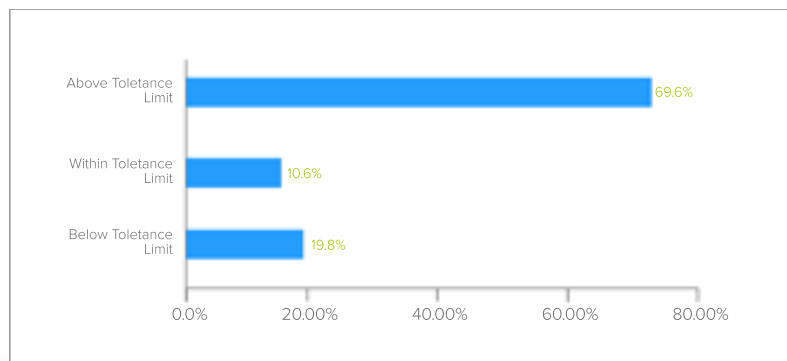

Using IPF it was noticed that in almost 70% instances the weight of the bag was above tolerance limit resulting in extra output per bag. At the same time approx 20% deviations are below tolerance limit indicating that every bag contains lower than expected output leading to major compliance issues.

## Action

This insight revealed that by tracking output weight of each bag, both compliance and revenue loss issues could be tackled.

## Impact

By tracking output weight, IPF enabled opportunity to save an additional INR 4.8 Crore/year and also resolving compliance issues.
